Demo / USB Security

A terminal window titled "[dom0] Terminal - herbert@dom0:~" displays system information. The window has a menu bar with "Datei", "Bearbeiten", "Ansicht", "Terminal", "Reiter", and "Hilfe". The content shows a list of libraries and their versions, formatted as "library version / version".

Library	Version	Version
libavformat	61. 7.100	61. 7.100
libavdevice	61. 3.100	61. 3.100
libavfilter	10. 4.100	10. 4.100
libswscale	8. 3.100	8. 3.100
libswresample	5. 3.100	5. 3.100
libpostproc	58. 3.100	58. 3.100

Hardware

To have an 'HVM' for gaming, you must have

- A dedicated GPU. By dedicated, it means: it is a secondary GPU, not the GPU used to display dom0. In 2023, 'Nvidia' and 'Amd' GPU work. Not tested with Intel GPUs. External GPU using thunderbolt work ([Create a Gaming HVM - #8 by solene](#))
- A screen available for the gaming 'HVM'. (It can be a physical monitor or just to have multiple cables connected to the screen and switching between input source) **[Optional]**
- Dedicated gaming mouse and keyboard **[Optional]** .

IOMMU Group

Goal

What

The goal of this step is to retrieve the default IOMMU Group ([VFIO - "Virtual Function I/O" — The Linux Kernel documentation](#) ⁸⁷) of your hardware.

Why

It can help understanding potential issue with your setup (what devices live in the same IOMMU group as your GPU) / finding potential workaround.
If you feel lucky, skip this step.

How
